• Cryptography has emerged as the practice or study of securing communications against third parties called adversaries.

< 17 > <

- Cryptography has emerged as the practice or study of securing communications against third parties called adversaries.
- Public Key Cryptography (PKC) was introduced to address key issues of Key Distribution Problem and Digital Signature Verification problems.

- Cryptography has emerged as the practice or study of securing communications against third parties called adversaries.
- Public Key Cryptography (PKC) was introduced to address key issues of Key Distribution Problem and Digital Signature Verification problems.
- The two most widely used primitives of PKC are RSA and Elliptic Curve Cryptography.

- Cryptography has emerged as the practice or study of securing communications against third parties called adversaries.
- Public Key Cryptography (PKC) was introduced to address key issues of Key Distribution Problem and Digital Signature Verification problems.
- The two most widely used primitives of PKC are RSA and Elliptic Curve Cryptography.
- Elliptic Curve Cryptography (ECC) has emerged as a strong alternative to RSA due to its property of more security per key bit.

• ECC scalar multiplication algorithm is mathematically secure against the ECDLP problem.

イロト イヨト イヨト イヨト

- ECC scalar multiplication algorithm is mathematically secure against the ECDLP problem.
- However ECC algorithms once implemented, the implementations suffer from side-channel leakage such as power (EM) leakage, timing leakage, acoustic leakage etc.

- ECC scalar multiplication algorithm is mathematically secure against the ECDLP problem.
- However ECC algorithms once implemented, the implementations suffer from side-channel leakage such as power (EM) leakage, timing leakage, acoustic leakage etc.

- ECC scalar multiplication algorithm is mathematically secure against the ECDLP problem.
- However ECC algorithms once implemented, the implementations suffer from side-channel leakage such as power (EM) leakage, timing leakage, acoustic leakage etc.
- Ladder, Unified Algorithm, Atomic formula: Countermeasure against Simple Power Analysis

- ECC scalar multiplication algorithm is mathematically secure against the ECDLP problem.
- However ECC algorithms once implemented, the implementations suffer from side-channel leakage such as power (EM) leakage, timing leakage, acoustic leakage etc.
- Ladder, Unified Algorithm, Atomic formula: Countermeasure against Simple Power Analysis
- Scalar Blinding, Point Coordinate Randomization: Countermeasure against Differential Power Analysis

• Horizontal Attacks are special attacks which threatens a SPA as well as DPA resistant implementation.

< 1[™] >

- Horizontal Attacks are special attacks which threatens a SPA as well as DPA resistant implementation.
- It involves few (single) number of traces to break the entire secret key.

- Horizontal Attacks are special attacks which threatens a SPA as well as DPA resistant implementation.
- It involves few (single) number of traces to break the entire secret key.
- Thus imposes a serious threat to ECC implementations.

• First seminal work in Horizontal Attacks was Big Mac Attack by Walter et. al.

- First seminal work in Horizontal Attacks was Big Mac Attack by Walter et. al.
- Big Mac Analysis followed several flavors of Horizontal attacks on the RSA-based exponentiation algorithms.

- First seminal work in Horizontal Attacks was Big Mac Attack by Walter et. al.
- Big Mac Analysis followed several flavors of Horizontal attacks on the RSA-based exponentiation algorithms.
- Horizontal Collision Correlation Analysis or HCCA by Bauer et. al. put forward the idea of Horizontal Attacks in case of elliptic curve cryptography.

- First seminal work in Horizontal Attacks was Big Mac Attack by Walter et. al.
- Big Mac Analysis followed several flavors of Horizontal attacks on the RSA-based exponentiation algorithms.
- Horizontal Collision Correlation Analysis or HCCA by Bauer et. al. put forward the idea of Horizontal Attacks in case of elliptic curve cryptography.
- HCCA threatens an atomic scheme ECC algorithm or unified ECC algorithm (Edward curve) with SPA, DPA resistance.

• HCCA is based on underlying field multiplications that constitute ECC point addition and doubling.

- HCCA is based on underlying field multiplications that constitute ECC point addition and doubling.
- It is based on the following assumption: The adversary can detect when a pair of field multiplications have at least one operand in common

- HCCA is based on underlying field multiplications that constitute ECC point addition and doubling.
- It is based on the following assumption: The adversary can detect when a pair of field multiplications have at least one operand in common
- If A, B, C and D be field multiplications considered without loss of generality, then following pairs can be defined

- HCCA is based on underlying field multiplications that constitute ECC point addition and doubling.
- It is based on the following assumption: The adversary can detect when a pair of field multiplications have at least one operand in common
- If A, B, C and D be field multiplications considered without loss of generality, then following pairs can be defined
- $(A \times B, A \times B)$: sharing both operands

- HCCA is based on underlying field multiplications that constitute ECC point addition and doubling.
- It is based on the following assumption: The adversary can detect when a pair of field multiplications have at least one operand in common
- If A, B, C and D be field multiplications considered without loss of generality, then following pairs can be defined
- $(A \times B, A \times B)$: sharing both operands
- $(A \times B, C \times B)$: sharing one operand

- HCCA is based on underlying field multiplications that constitute ECC point addition and doubling.
- It is based on the following assumption: The adversary can detect when a pair of field multiplications have at least one operand in common
- If A, B, C and D be field multiplications considered without loss of generality, then following pairs can be defined
- $(A \times B, A \times B)$: sharing both operands
- $(A \times B, C \times B)$: sharing one operand
- $(A \times B, C \times D)$: sharing no operand

• Following properties have been defined:

- Following properties have been defined:
- *property* 1: When a pair of multiplications (*m_i*, *m_j*) share one (two) common operand (s).

- Following properties have been defined:
- *property* 1: When a pair of multiplications (*m_i*, *m_j*) share one (two) common operand (s).
- property 1a: When a pair of multiplications (m_i, m_j) share one common operand. For example: (A × B, C × B)

- Following properties have been defined:
- *property* 1: When a pair of multiplications (*m_i*, *m_j*) share one (two) common operand (s).
- property 1a: When a pair of multiplications (m_i, m_j) share one common operand. For example: (A × B, C × B)
- property 1b: When a pair of multiplications (m_i, m_j) share two common operands. For example: $(A \times B, A \times B)$

- Following properties have been defined:
- *property* 1: When a pair of multiplications (*m_i*, *m_j*) share one (two) common operand (s).
- property 1a: When a pair of multiplications (m_i, m_j) share one common operand. For example: (A × B, C × B)
- property 1b: When a pair of multiplications (m_i, m_j) share two common operands. For example: $(A \times B, A \times B)$
- property 2: When a pair of multiplications (m_i, m_j) share no common operand among themselves. For example: (A × B, C × D)

イロト イポト イヨト イヨト

• HCCA can be launched in two scenarios.

- HCCA can be launched in two scenarios.
- HCCA scenario 1:

- HCCA can be launched in two scenarios.
- HCCA scenario 1:
- ECC point doubling can be considered as a set set_d of n_d underlying field multiplications $(d_1, d_2, \ldots, d_{n_d})$

- HCCA can be launched in two scenarios.
- HCCA scenario 1:
- ECC point doubling can be considered as a set *set_d* of *n_d* underlying field multiplications (*d*₁, *d*₂, ..., *d_{n_d}*)
- ECC point addition can be considered as a set set_a of n_a underlying field multiplications $(a_1, a_2, \ldots, a_{n_a})$

- HCCA can be launched in two scenarios.
- HCCA scenario 1:
- ECC point doubling can be considered as a set *set_d* of *n_d* underlying field multiplications (*d*₁, *d*₂, ..., *d_{n_d}*)
- ECC point addition can be considered as a set set_a of n_a underlying field multiplications $(a_1, a_2, \ldots, a_{n_a})$
- HCCA scenario 1 is based on condition 1 defined below:

- HCCA can be launched in two scenarios.
- HCCA scenario 1:
- ECC point doubling can be considered as a set set_d of n_d underlying field multiplications $(d_1, d_2, \ldots, d_{n_d})$
- ECC point addition can be considered as a set set_a of n_a underlying field multiplications $(a_1, a_2, \ldots, a_{n_a})$
- HCCA scenario 1 is based on condition 1 defined below:
- condition 1: Only one of the sets set_a and set_d satisfies property 3.

HCCA scenario 1

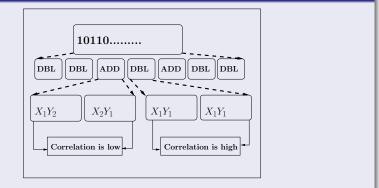

Figure: HCCA scenario 1

크

イロト イヨト イヨト イヨト

• HCCA scenario 2:

크

イロト イヨト イヨト イヨト

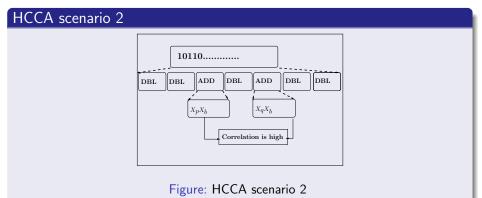

- HCCA scenario 2:
- Scenario 2 is based on the fact: In point addition operation one of the point parameter is always the base point.

- HCCA scenario 2:
- Scenario 2 is based on the fact: In point addition operation one of the point parameter is always the base point.
- It holds irrespective of the curve equation or the unified formula steps involved in the scalar multiplication.

- HCCA scenario 2:
- Scenario 2 is based on the fact: In point addition operation one of the point parameter is always the base point.
- It holds irrespective of the curve equation or the unified formula steps involved in the scalar multiplication.

Long Integer Multiplication

Algorithm 1: Long Integer Multiplication algorithm(LIM)

```
Data: : {X = (X[t], X[t-1], ..., X[1])_{2^{w}}}, {Y = (Y[t], Y[t-1], ..., Y[1])_{2^{w}}}
Result: : \{X,Y\}
begin
     for i \leftarrow 1 to 2t do
          R[i] = 0
     end
     for i \leftarrow 1 to t do
          C = 0 :
          for i \leftarrow 1 to t do
                (U,V)_{2^w} = X[i] \times Y[i];
                (U, V)_{2^{W}} = (U, V)_{2^{W}} + C;
                (U, V)_{2^{W}} = (U, V)_{2^{W}} + R[i + j - 1];
                R[i+i-1] = V;
                C = U^{\cdot}
          end
          R[i+t] = C:
     end
     return R :
end
```

• Let C_i be the operation leaking information at each iteration.

A 🖡

- Let C_i be the operation leaking information at each iteration.
- The output of the calculation C_i is denoted as O_i

- Let C_i be the operation leaking information at each iteration.
- The output of the calculation C_i is denoted as O_i
- At each iteration output O_i leaks an information $I(O_i)$

- Let C_i be the operation leaking information at each iteration.
- The output of the calculation C_i is denoted as O_i
- At each iteration output O_i leaks an information $I(O_i)$
- The leakage *l*(*O_i*) is approximated by the Hamming Weight power model.

- Let C_i be the operation leaking information at each iteration.
- The output of the calculation C_i is denoted as O_i
- At each iteration output O_i leaks an information $I(O_i)$
- The leakage *l*(*O_i*) is approximated by the Hamming Weight power model.
- A long integer multiplication LIM(A, B) leads to a leakage vector $< l_{(a_0b_0)}, l_{(a_0b_1)}, \ldots, l_{(a_ib_j)}, \ldots, l_{(a_{t-1}b_{t-1})} >$

• $\rho_1 = Corr(LIM(A, B), LIM(C, B))$

- HCCA scenario 2: Same input point is used in all addition steps
- Re-randomization: Use randomize input point at each stage of addition steps
- After the end of scalar multiplication loop, de-randomize the results¹.
- Similar re-randomization can be used to mitigate other single trace collision attacks ².

• We have shown how the property of asymmetric leakage of field multipliers can be utilized to construct a low-cost countermeasure which is able to defeat the powerful HCCA.

- We have shown how the property of asymmetric leakage of field multipliers can be utilized to construct a low-cost countermeasure which is able to defeat the powerful HCCA.
- We show how a unified addition (doubling) formula can be converted into a safe sequence where, the information leakage from sharing of operands among field multipliers have been hidden. Once the sequence have been determined through Algorithm 1 there is no runtime overhead requirement for the step 1 of our countermeasure.

- We have shown how the property of asymmetric leakage of field multipliers can be utilized to construct a low-cost countermeasure which is able to defeat the powerful HCCA.
- We show how a unified addition (doubling) formula can be converted into a safe sequence where, the information leakage from sharing of operands among field multipliers have been hidden. Once the sequence have been determined through Algorithm 1 there is no runtime overhead requirement for the step 1 of our countermeasure.
- We have validated HCCA and our proposed countermeasure scheme on a SASEBO platform.

Thank You
